# Today's Talk

---

- Strategic goal: LOS
    - Logistics: Operations
    - Intelligence: Weather information
  - Intro: Weather information
  - Key environmental measurements
    - Air temperature
    - Humidity
    - Wind
    - Pressure
    - Visibility
    - Precipitation
    - Solar radiation
    - Soil temperature
    - Road temperature
    - Road condition
  - Concluding thoughts
- 
- What it is
  - Why it matters

**Strategic Goals (LOS)**

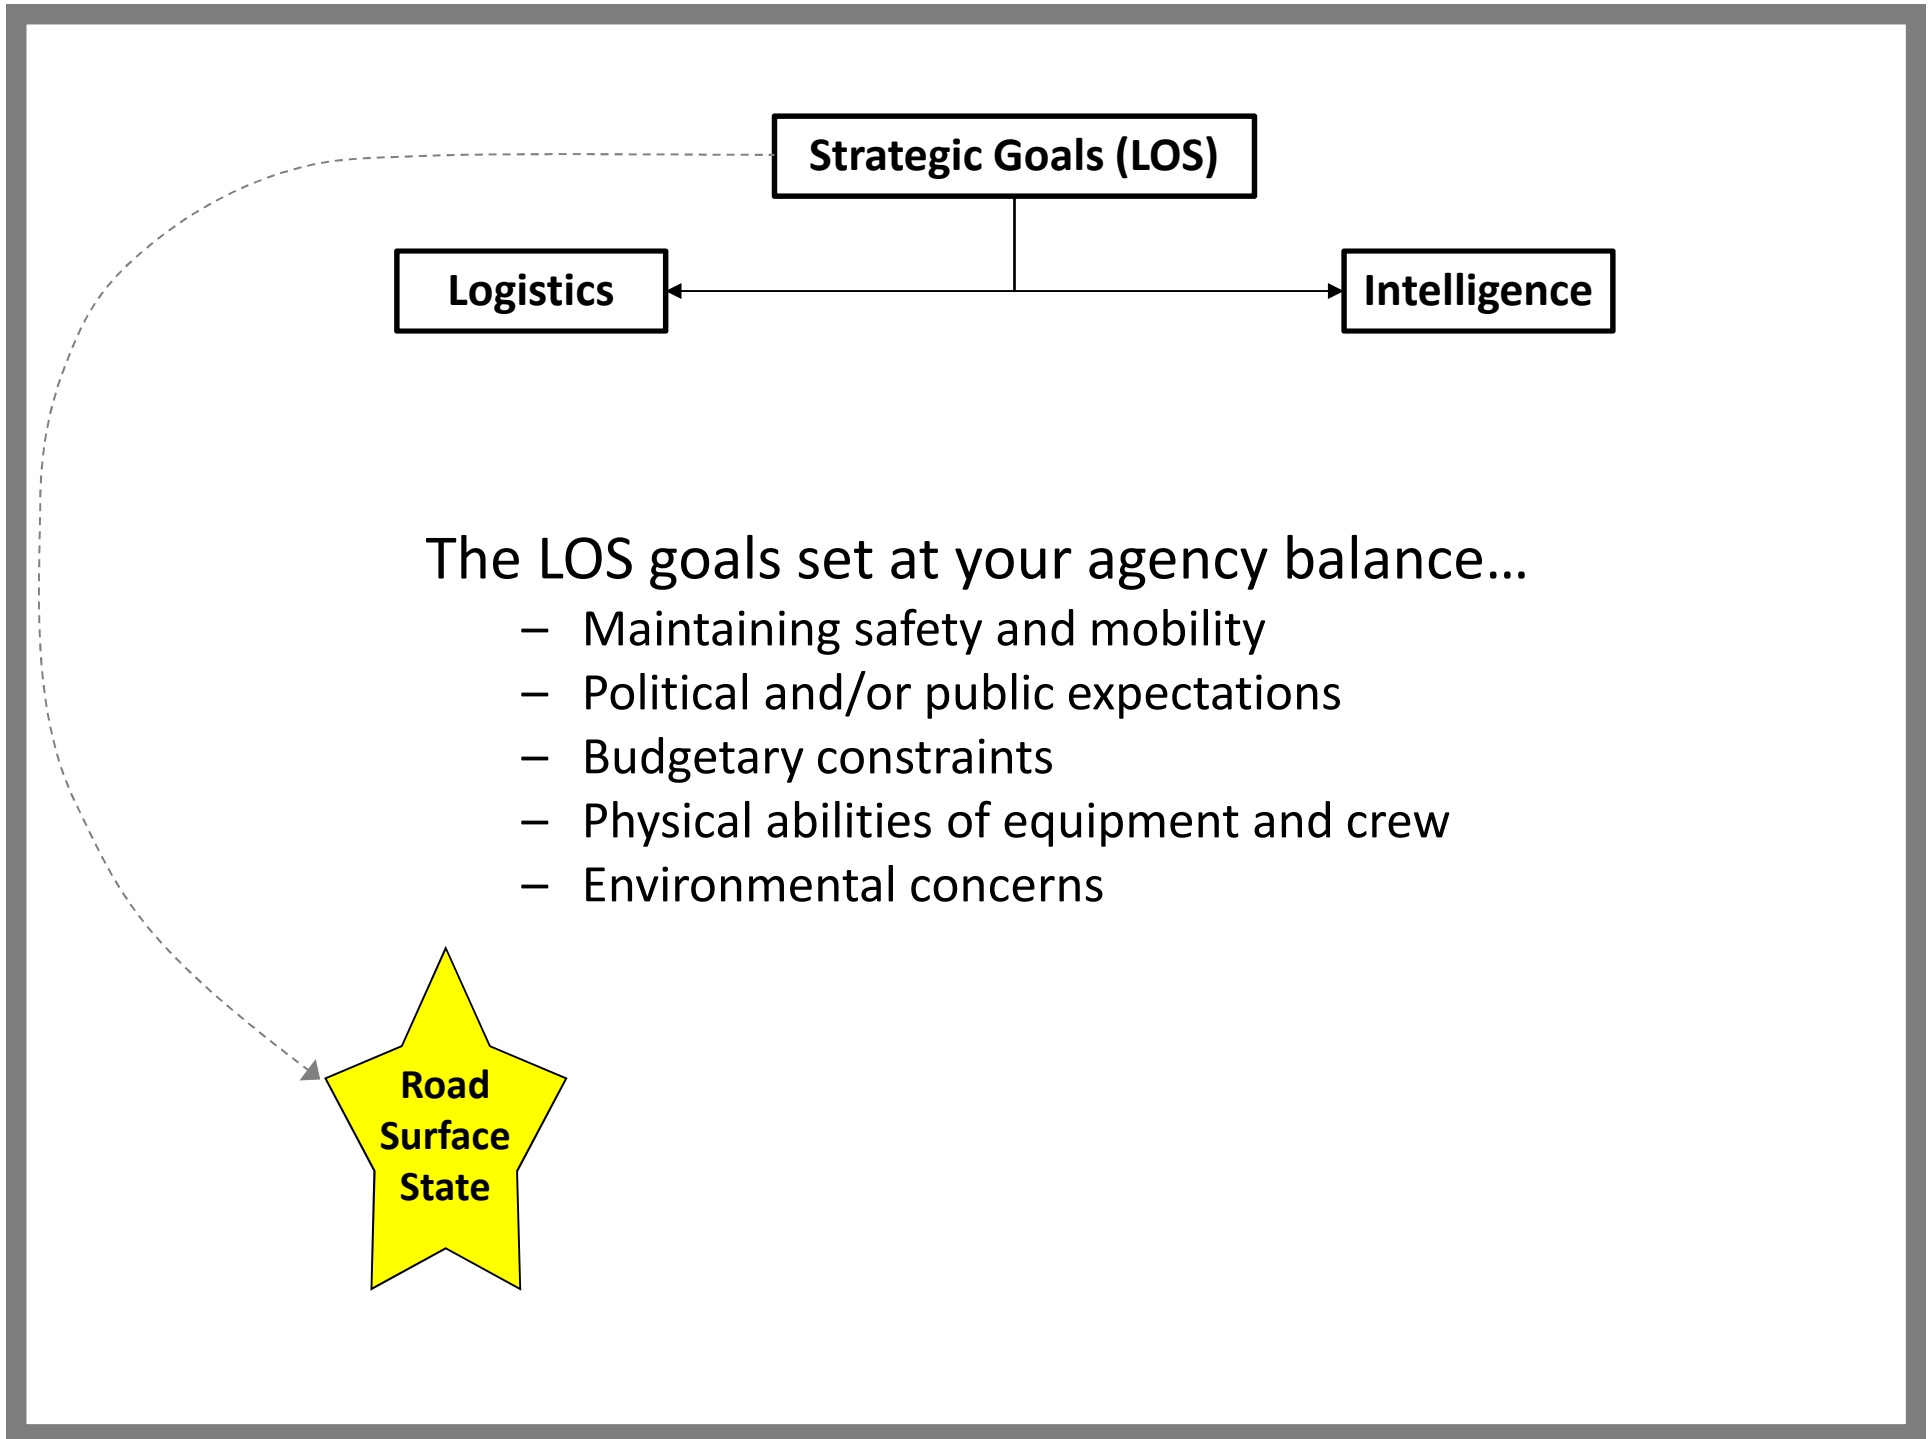

**Logistics**

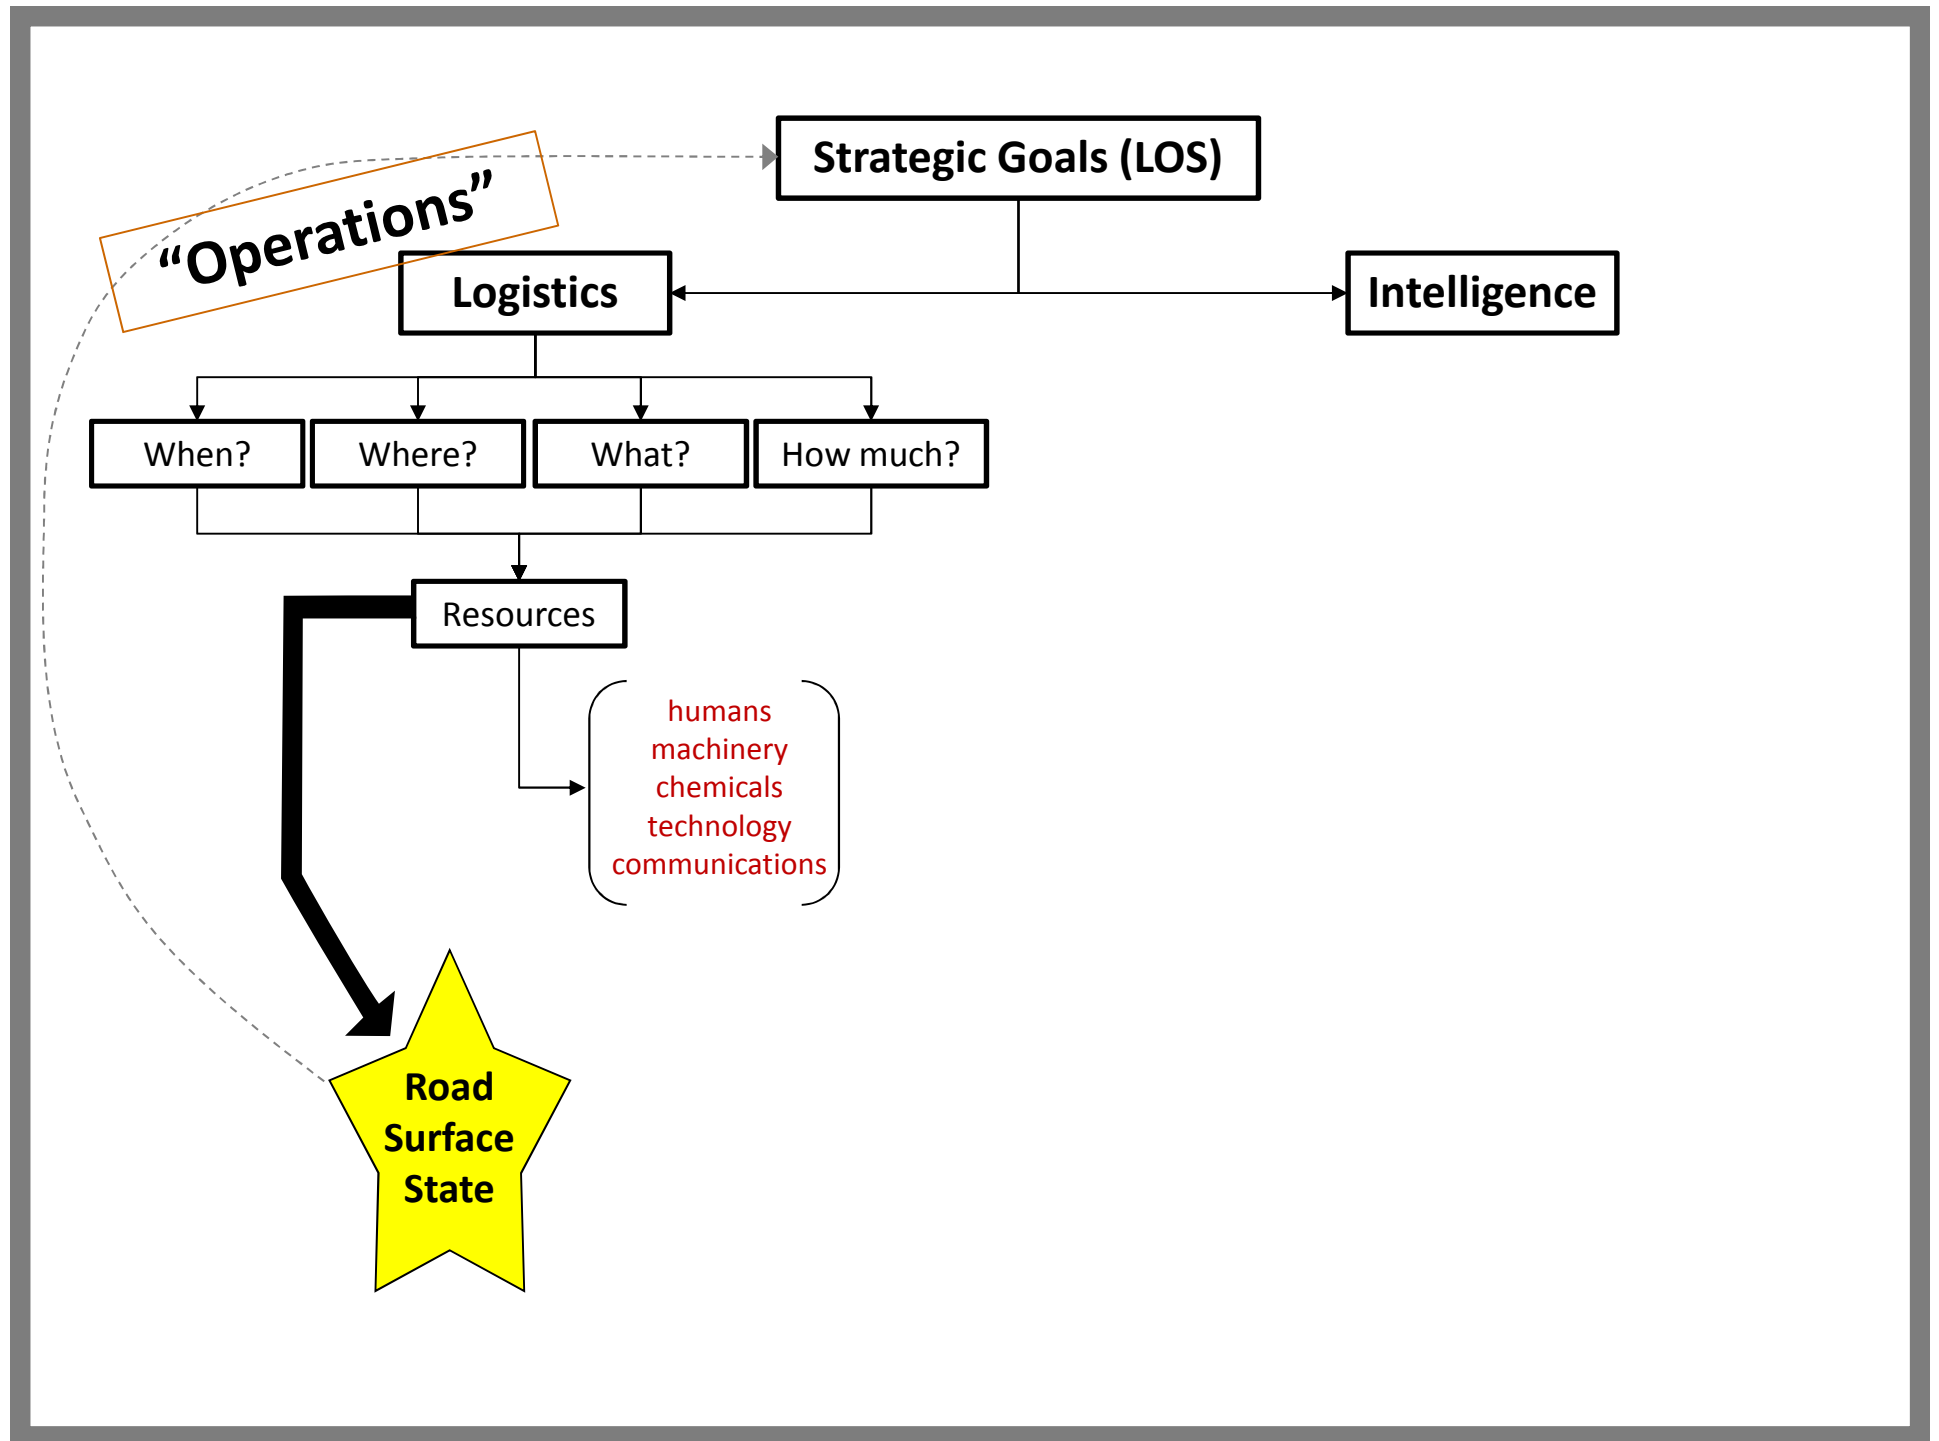

**Intelligence**

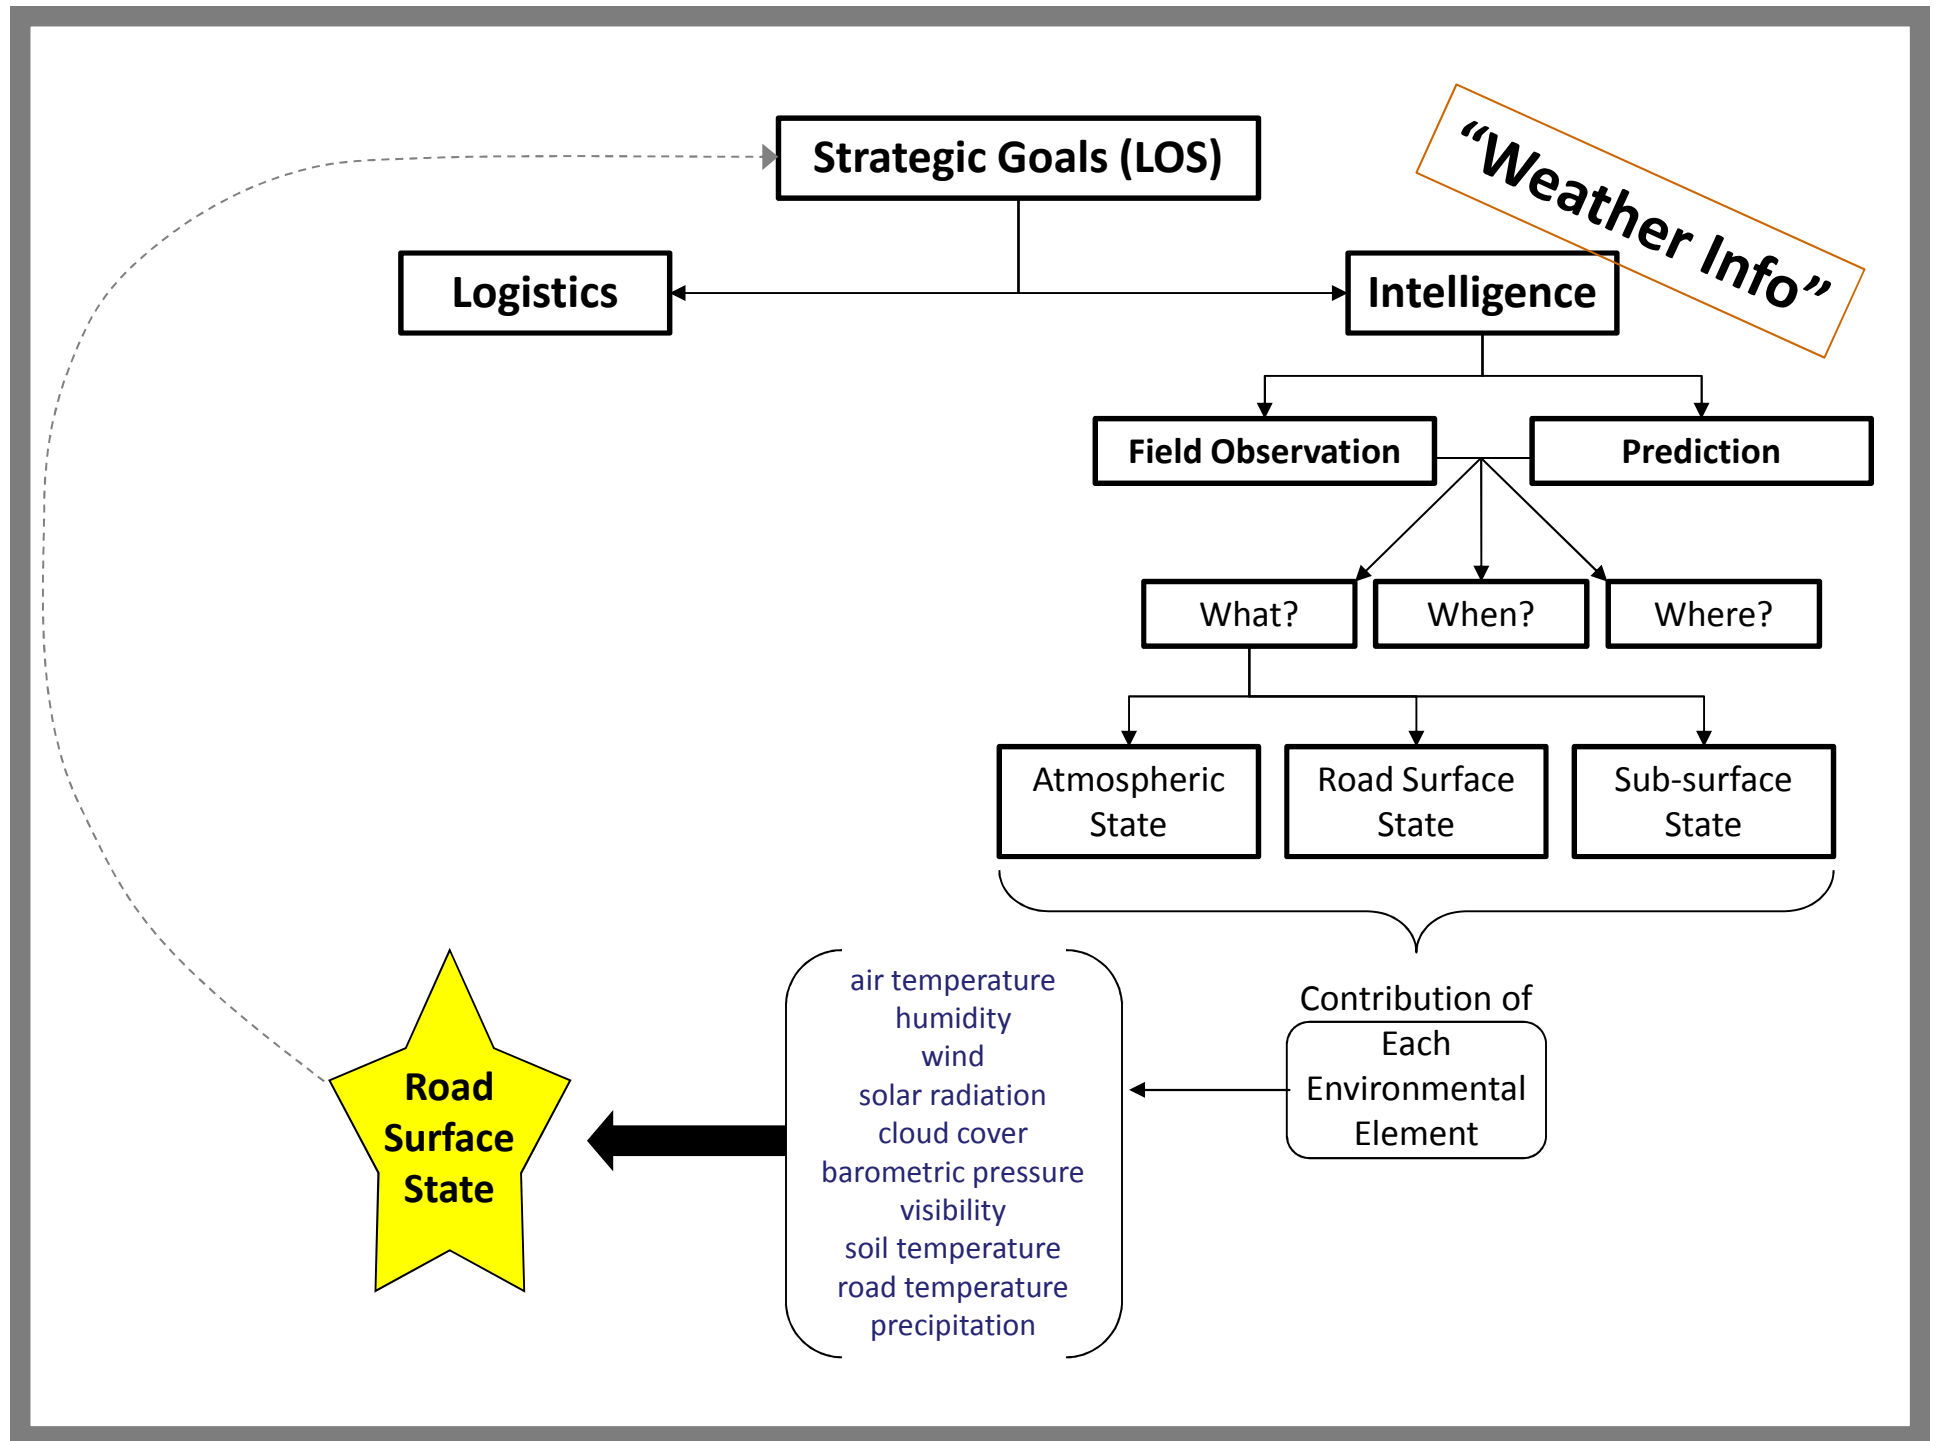

The LOS goals set at your agency balance...

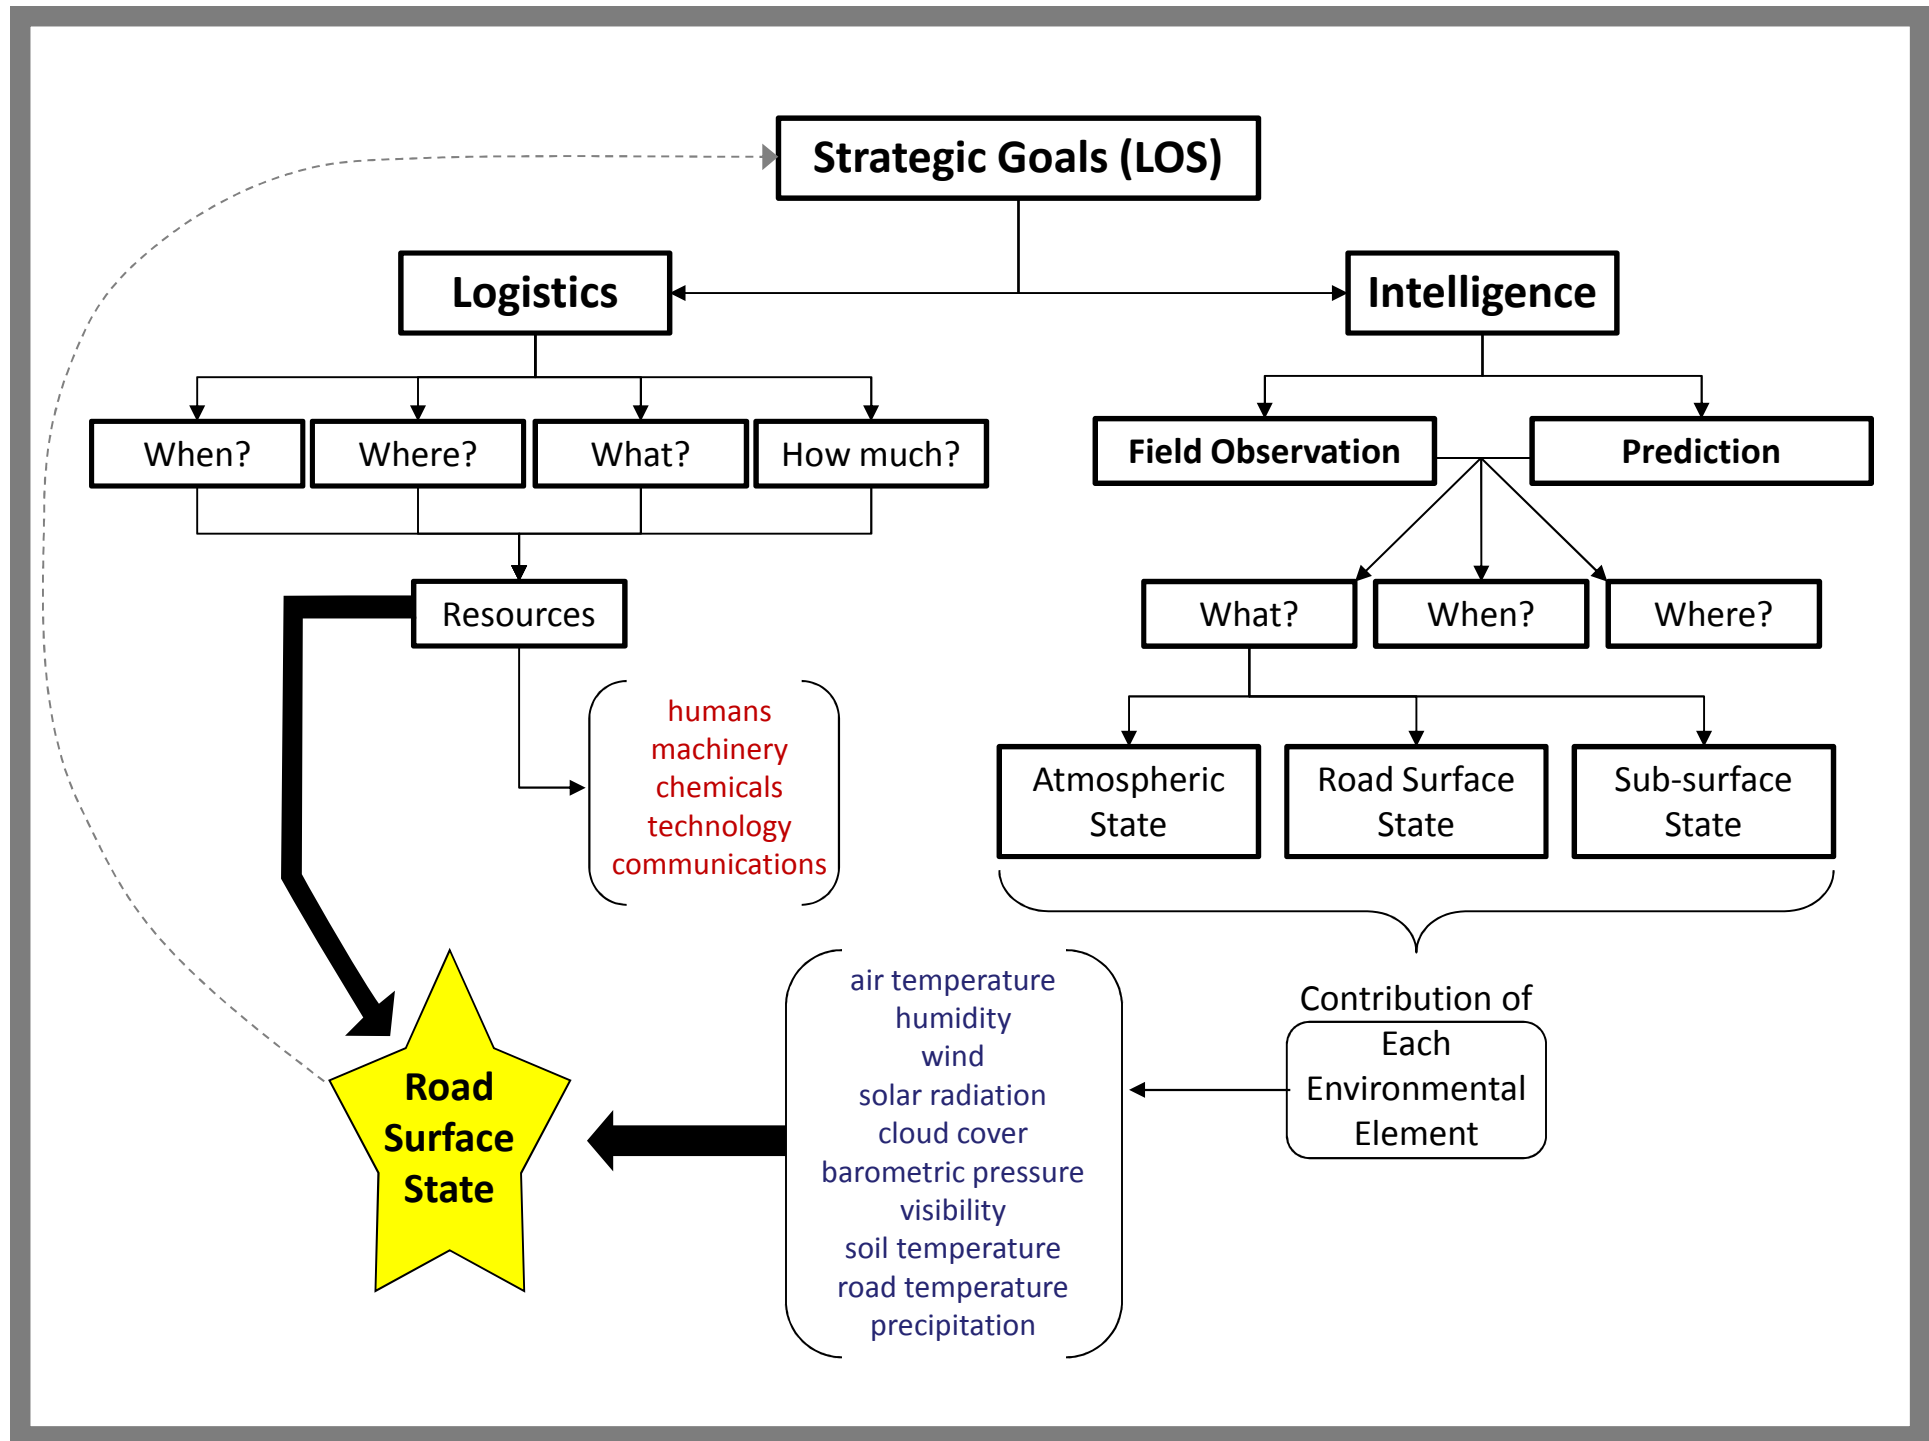

- Maintaining safety and mobility
- Political and/or public expectations
- Budgetary constraints
- Physical abilities of equipment and crew
- Environmental concerns

**Road  
Surface  
State**

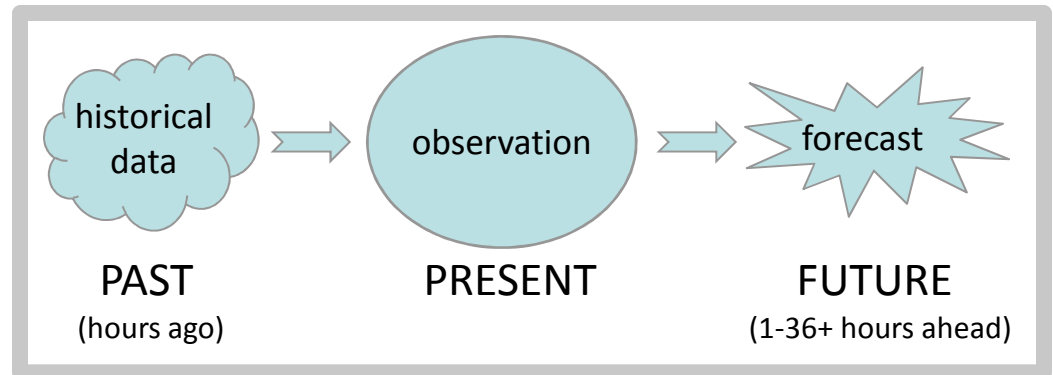

# **Intro: Weather Information**

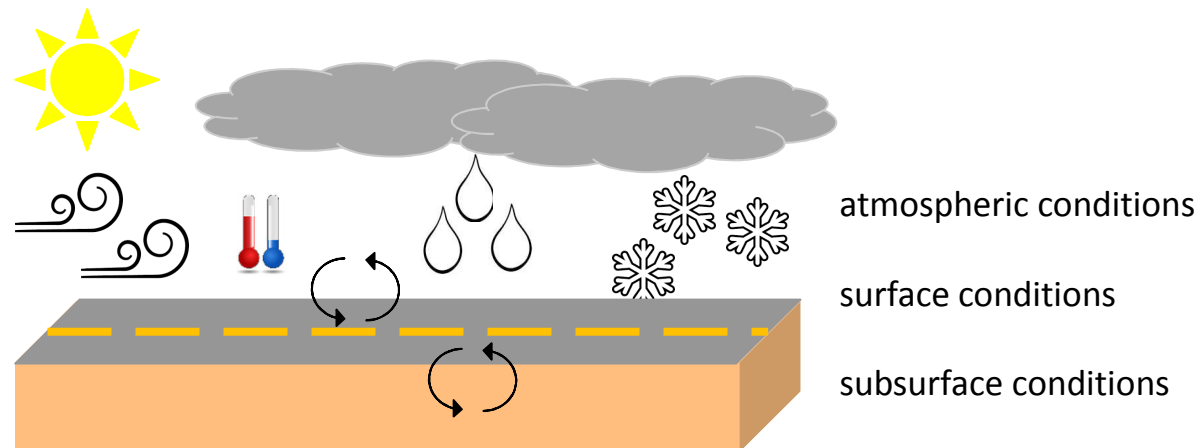

---

# Weather Information

- Weather information is:
  - Field observations
    - Current and historical
  - Forecasts
    - Future state of those observations

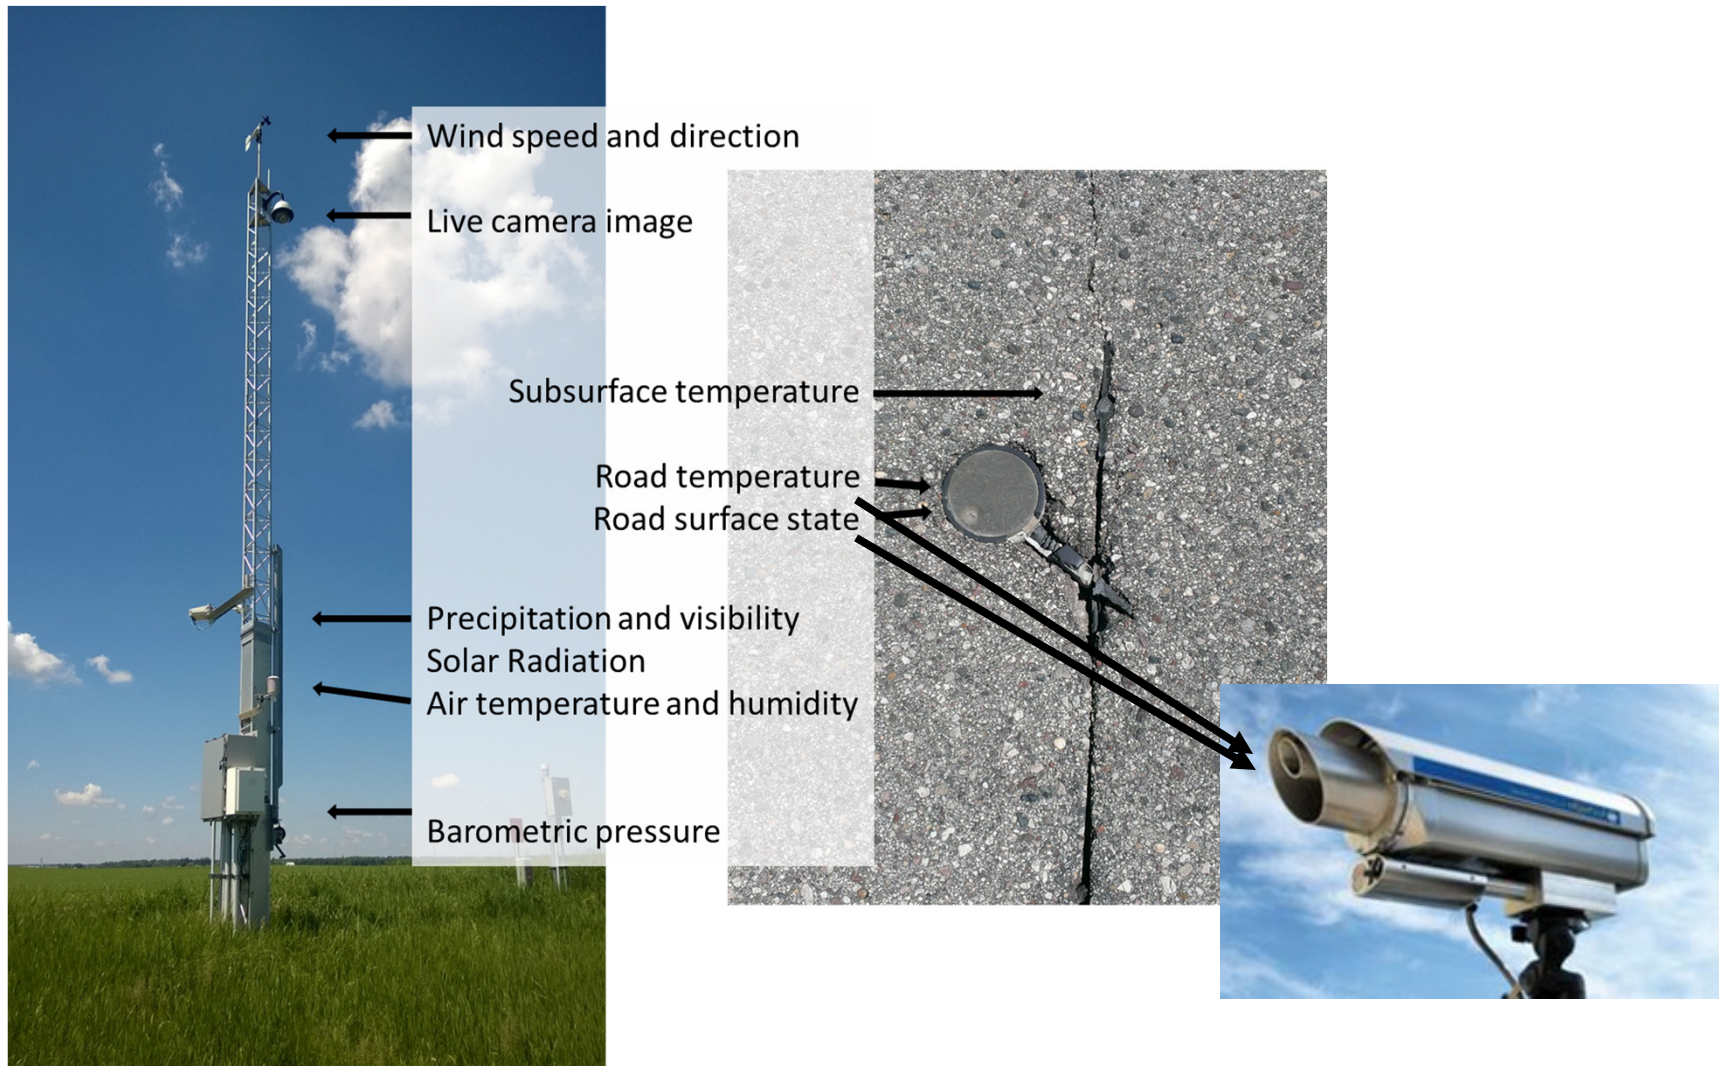

- All environmental elements that affect road surface state must be considered

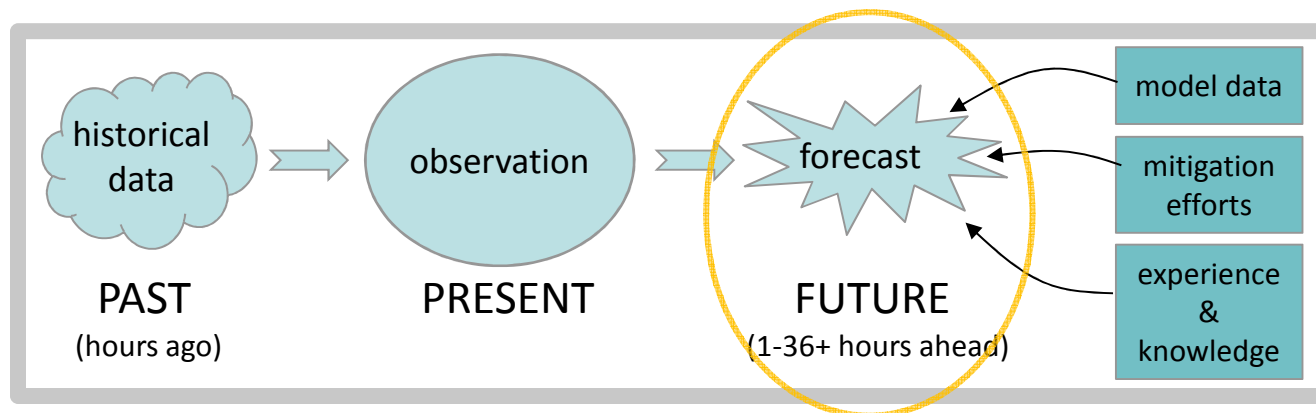

# Field Observations: RWIS

# Forecasts

- Forecasters...
  1. Figure out the future state of each element,
  2. How it will affect road surface state, and
  3. Communicate the part that matters to you
- They do this by combining different inputs:
  - Past environmental conditions
  - Current environmental conditions
  - Model data
  - Mitigation efforts
  - Physical understanding of the system (knowledge and experience)

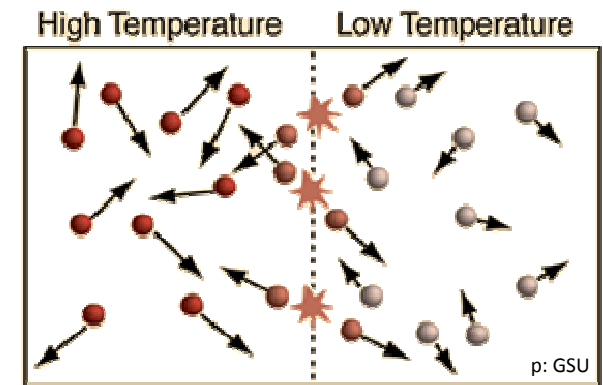

# Environmental Measurements

# Air Temperature

- What it is:
  - Air temperature is the average kinetic energy of molecules in the atmosphere

- Why it matters:
  - Affects road surface temp
  - Affects precipitation type
    - Rain-snow level
    - Rate of change through a storm
  - Warm air is less dense
  - Cold air is more dense

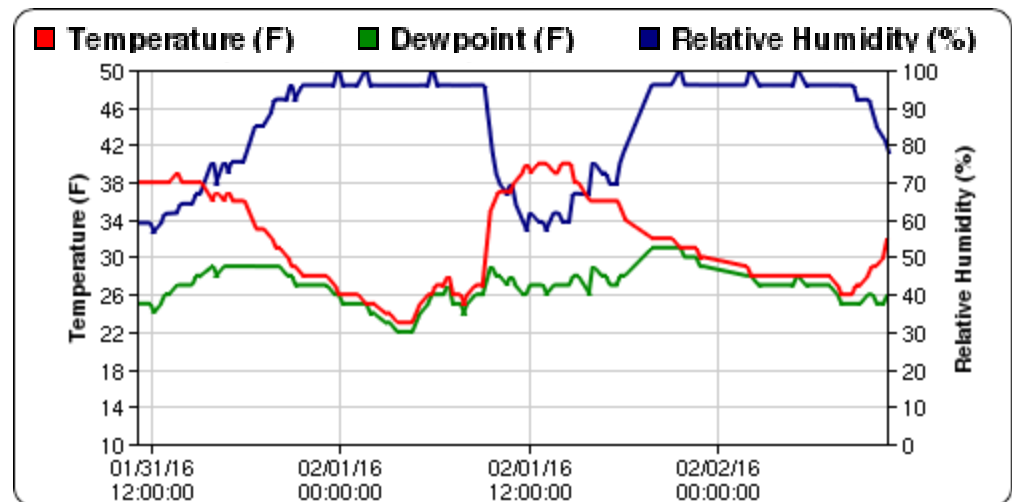

# Humidity

- What it is:
  - The amount of water vapor in the air
  - Relative humidity – Amount of water vapor in the air compared to the amount of water vapor the air can hold – how close the air is to *saturation* (100%)
  - Dewpoint temperature – The temperature at which the air would reach saturation

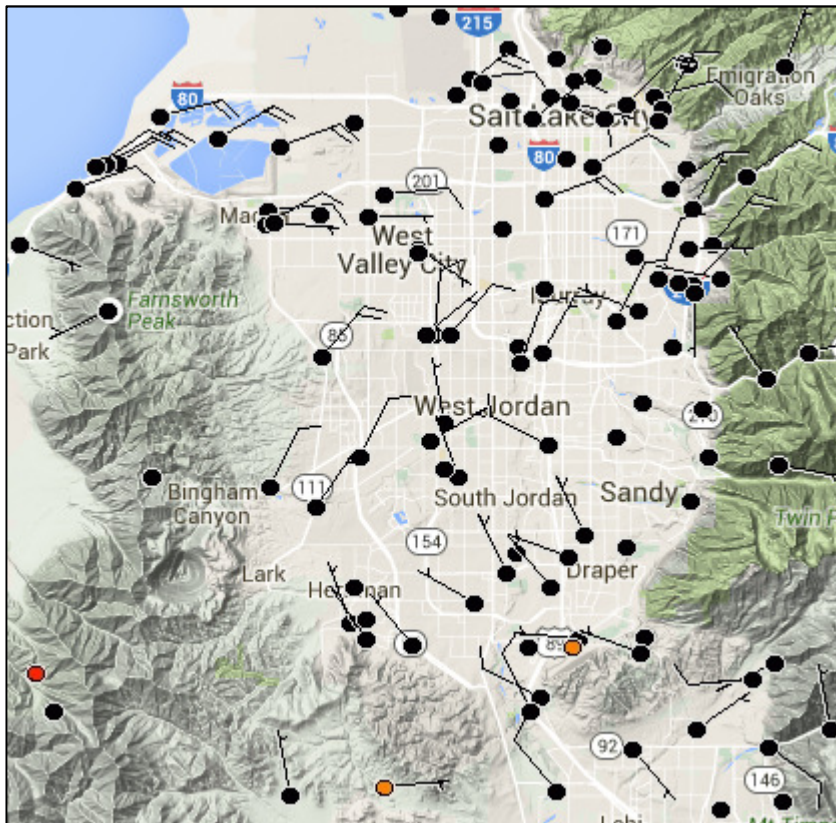

- Why it matters:
  - When used with air temperature:
    - Fog or freezing fog
    - Deposition onto roads
  - When used with road temperature:
    - Wet or frosty roads

# Wind: Reading Wind Barbs

Direction and Speed

# Wind

- What it is:
  - Physical motion of air
  - Caused by differences in pressure/temperature
  - Varies greatly between the surface and the upper levels

Wind profile  
(Spokane)

2 June 2016, 5 am

## Wind @ 20,000 ft

Large-scale atmospheric waves

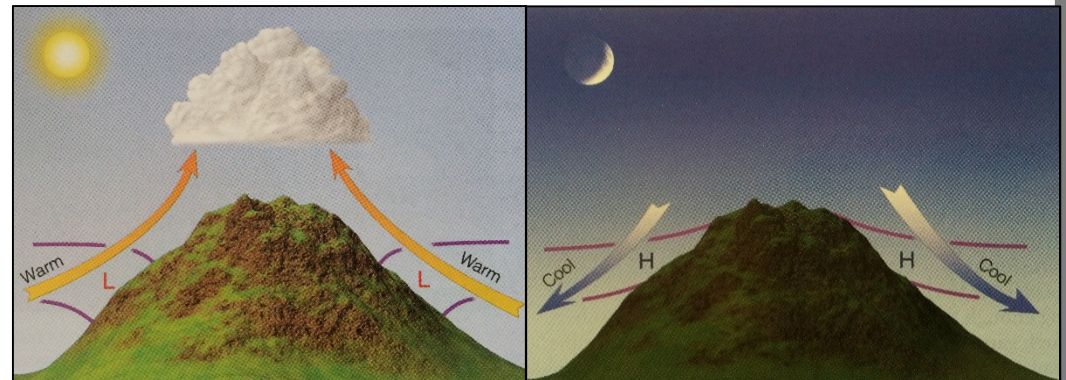

## Wind @ surface

Driven by terrain, temperature differences, and large-scale weather

# Wind

- Why it matters:
  - Blowing snow after precipitation stops
  - Reducing visibility
  - Moderates temperature at night
    - Reduces frost development
- A few specific phenomena:
  - Daily mountain/drainage
  - Gap winds
  - Downslope wind events

# Visibility

---

- What it is:
  - Distance visible light is able to pass through a medium
- Why it matters:
  - Can give you a *sense* of how intensely it's precipitating
  - Operational considerations:
    - How visible are your plows?
    - How visible are other obstacles?

# Precipitation

- What it is:

- Hydrometeors
- Type, intensity, duration

- How we forecast it:

- Observe moisture upstream (satellite & radar)
- Model forecasts
- Knowledge of precipitation forcing mechanisms

- How we measure it:

- Radar\*
- RWIS sensors

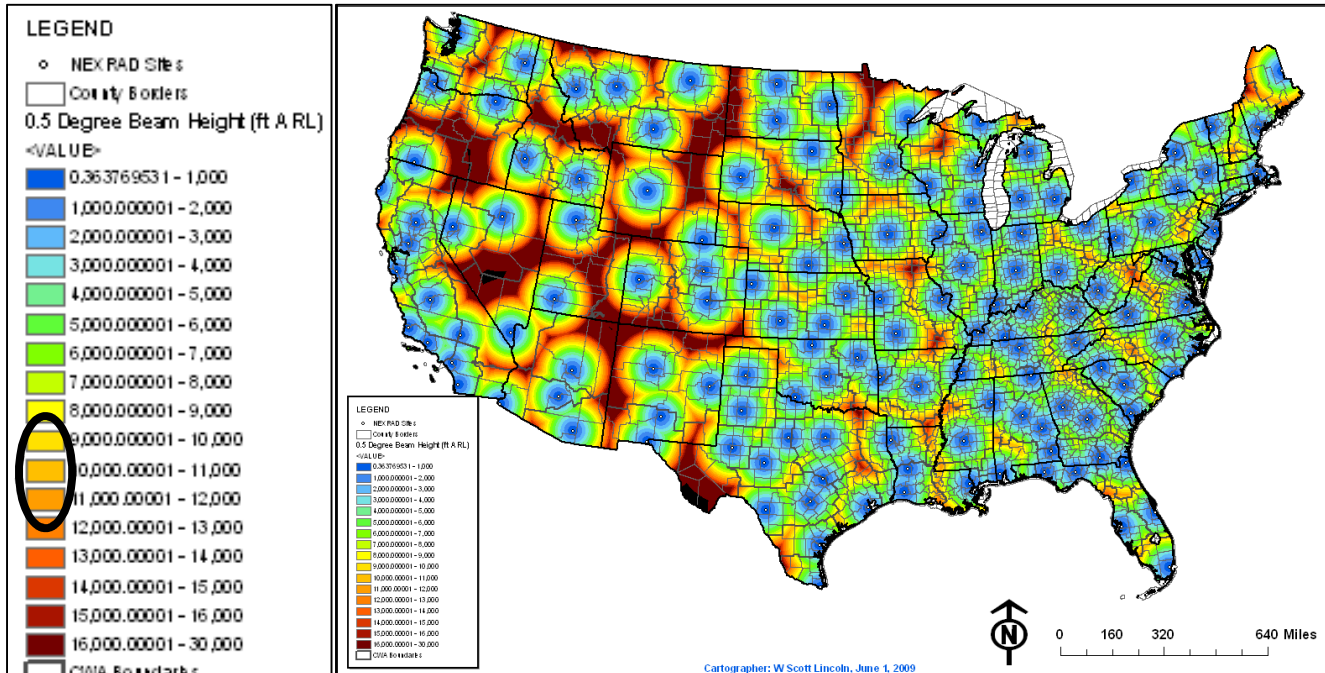

# Radar Basics

- Radars...
  1. Emit a radio beam that is reflected off of particles in the atmosphere.
  2. Use an antenna to capture the reflected signal back at the radar site.
  
- The amount of *reflectivity* measured back at the radar represents the amount of precipitation (number and size of hydrometeors).

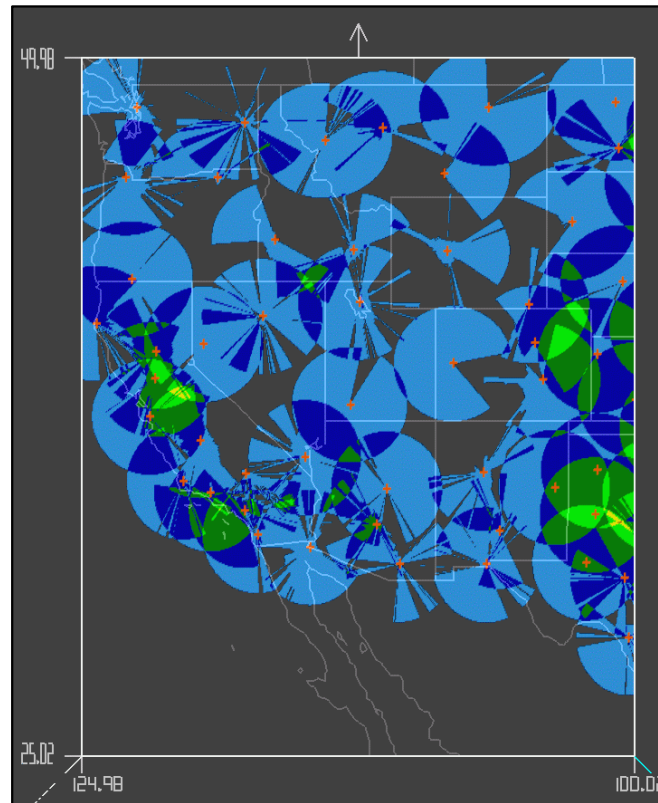

# Radar Coverage in the West

## Beam Overshooting

# Radar Coverage in the West

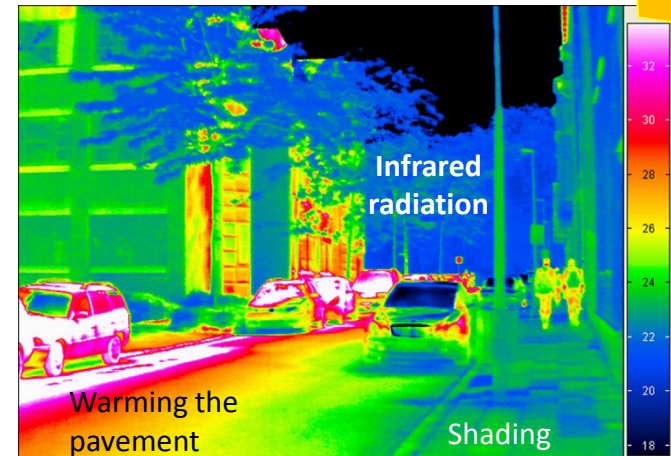

Beam Blockage

# Solar Radiation

- What it is:
  - Radiation that comes from the sun
  - Solar radiation is *absorbed by* a surface; surface is heated.
  - Heated surface *emits* infrared radiation.

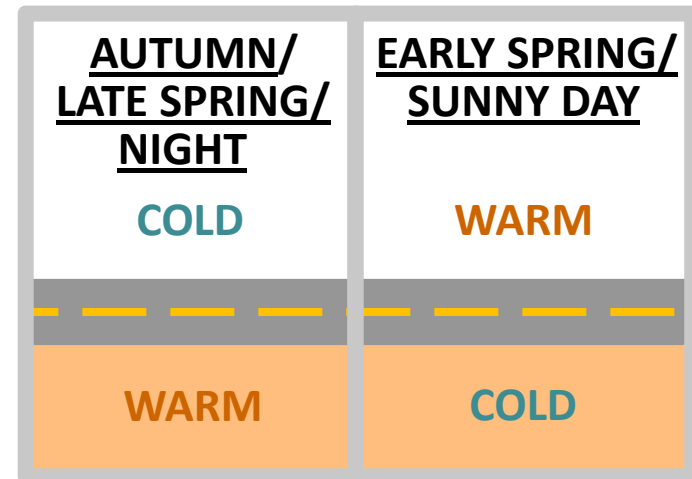

- Why it matters:
  - Road surface absorbs radiation very efficiently
  - Solar radiation is very susceptible to:
    - Angle—time of year, time of day, latitude
    - Obstacles—cloud cover, terrain, trees, buildings
  - Clouds block radiation during the day, but hold it in at night
    - Like a blanket

# Soil Temperature

- What it is:
  - Temperature of the pavement's underlying structure
  - Usually measured at 18" depth

- Why it matters:
  - Heat retention and transfer to pavement surface
- Think about how not having a substrate—i.e., bridge deck—affects pavement temperature.

# Road Temperature

- What it is:
  - The amount of infrared radiation emitting from the pavement
  - Dependent upon **solar radiation**, **subsurface temperature**, and **air temperature**

- Why it matters:
  - Dictates road surface state:
    - How precipitation will behave when it contacts surface
    - Development of frost (when used with dewpoint)
  - Dictates which chemicals to use

# Road Condition

- What it is:
  - The physical state of water on the pavement surface: none/dry, damp, wet, ice, snow, slush
  - Or the grip/friction of the surface
  - Or the eutectic (freezing) point of the water-salt solution
  - Or dry salt residual

- Why it matters
  - Being able to measure this through a storm helps to determine further mitigation efforts
  - Verify mitigation results throughout a storm
  - Informs how chemicals will/will not adhere

# Camera Image

- When the camera image is helpful:
  - Helping you learn meaning of RWIS data
  - Verification of snow on roads
  - Visibility
  - Wet vs dry roads
  - Traffic congestion

Icy or wet?

- When the camera image is *not* helpful:
  - Falsely identifying icy vs wet
  - No way to determine friction
  - Lack of light at night
  - Snow-packed camera lens

So you know the road is salty, but can you tell the freezing point? Surface friction?

# Concluding Thoughts

---

# What (More) Can RWIS Do For You?

Before the RWIS is installed:

- Site RWIS in strategic locations
  - Use the right sensors for the right spot
  - Think outside the box
  - Work with partners
  - Have a 5-year plan

Good practice for operations:

- Perform twice-annual calibration and preventative maintenance(!)
- Make room for response maintenance
- Quality control the data
- Metadata...metadata...metadata
- Archive the data and make it readily accessible
  - Post-storm analyses (what went well, what didn't, and why?)
  - Use for training or performance measurement
  - Severity indices

ITD's  
performance  
scale

# What (More) Can A Forecast Do For You?

---

- Ask yourself: Where is the human in the loop?
- Humans are important, because...
  - Forecasting the weather is still an art
  - Humans can recognize patterns and make comparisons to prior storms
  - Humans can communicate uncertainty in human terms, not just statistical or probabilistic terms
    - Humans can be descriptive and nuanced in their communication
  - If something changes, the human can relay that at that time and can describe the change to the crew
  - Can more easily adjust their biases and errors than a model
  - Mountain weather is important in the west, and models don't handle it well

# Questions?

# Supplementary Slides

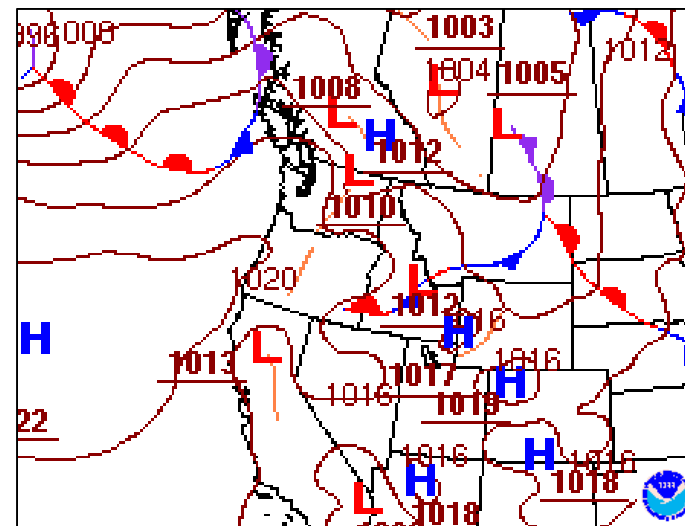

---

# Barometric Pressure

- What it is:
  - The weight of a column of air over a given area at ground or sea level
- Why it matters:
  - Important for meteorologists denoting a change in the weather
  - Pressure, temperature and wind are all related
  - Used to forecast...
    - Wind storm development
    - Daily coastal weather
    - Strength of cyclones

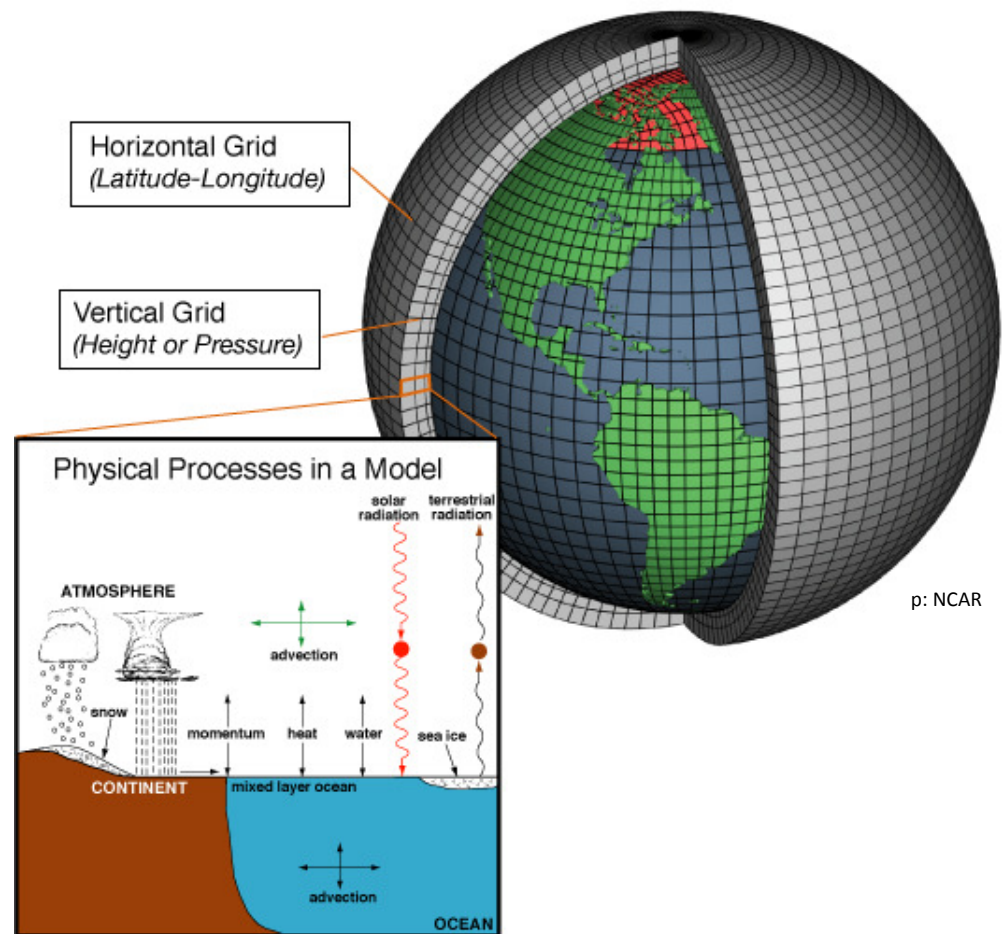

# The Physics of the Forecast

- How do we estimate the future state?

- A weather model:

1. Collects observations
2. Builds an estimate of the current atmosphere
3. Estimates the future of the atmosphere
  - Using physical and thermodynamical equations

- Forecasters understand the science *and* know how to communicate what matters to you

# Key Trouble Spots

---

- Low areas (cold pooling)
- Areas by water (humidity)
- Bridges
- Shady spots (solar radiation; terrain, buildings, trees)
- Gaps in terrain (wind)
- Summits and lee slopes (orographic enhancement)
- But that doesn't necessarily mean you put your RWIS there

# Seasonal Forecasts

---

- What you'd want to know and what they might include
- Why they should not be used to make operational plans

# Summary

---

- Bring it back to the operational goal: good intel builds your logistical plan, helping you reach your goal efficiently
