

AVL and Salt Management

Tina Greenfield
Iowa Department of Transportation

Pacific Northwest Snowfighters
June 2023

About This Presentation

A review of spreader systems and methods we use for controlling salt placement and reducing waste. Also, see how we use AVL for in-storm operations, and how we use it with other winter data to improve our operations.

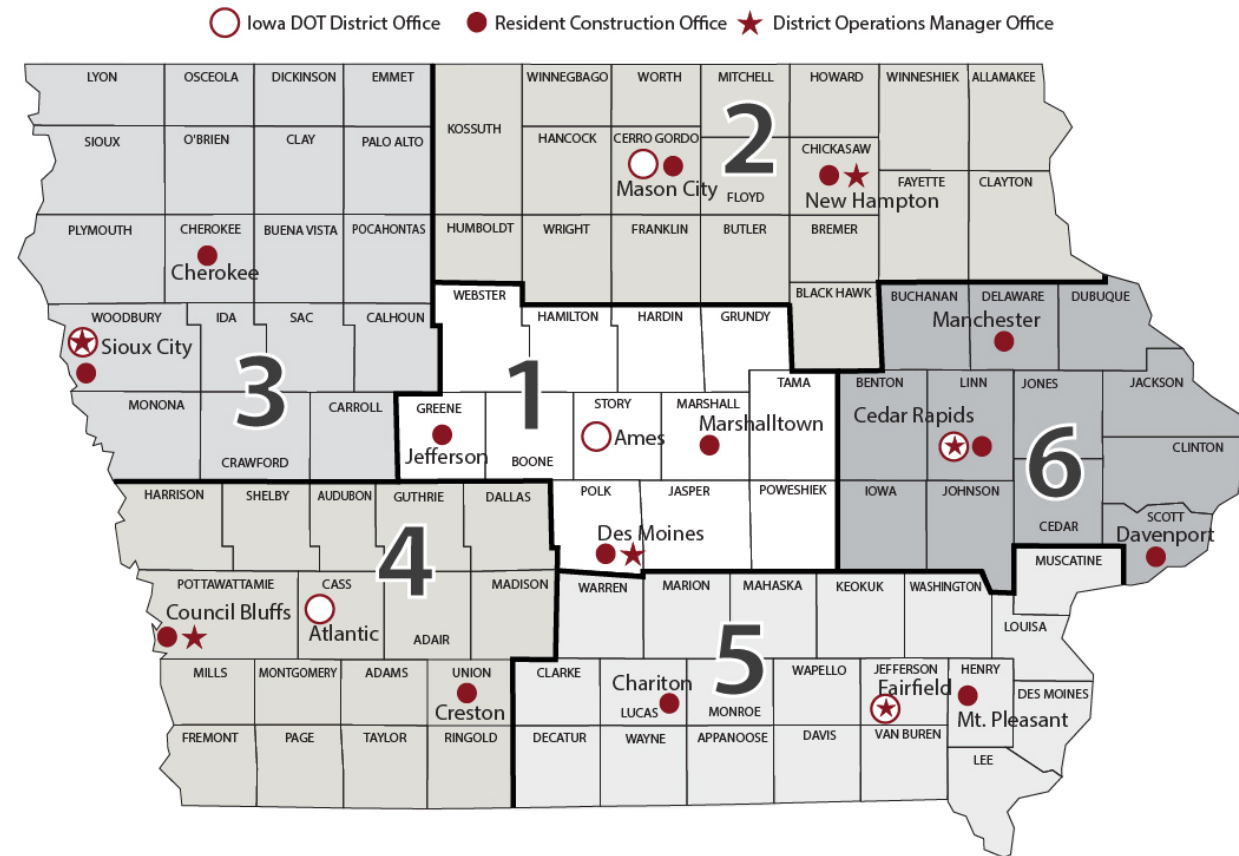

Topics

- About Iowa DOT
- Spreader systems
- Wheel-track placement technique
- Bounce and scatter testing
- AVL overview
- Info for process improvement

About Iowa DOT

- 6 Districts
- 100 maintenance garages
- 24,500 lane-miles of roadway, 24-hour operation
- Approx. 840 full-time operators
- Approx. 500 seasonal operators
- 5-year average material:
 - 156,600 tons salt
 - 31.5 Million gallons brine
 - 21,600 tons sand

Winter Materials

- Salt is our primary anti-icer, pre-wet, and deicer
- We use lots of brine. About 20M-30M gallons annually
- ~42,000 gallons Calcium Chloride as brine mix-in when needed
- ~20,000 tons sand

2500 Gal. Trailers

900 Gal Wedge Tanks

5000 Gal. Tankers

WARNING
Rotating machinery. Keep hands and feet clear. Do not touch or adjust while operating. Do not touch or adjust while operating. Do not touch or adjust while operating.

DANGER
High pressure. Do not touch or adjust while operating. Do not touch or adjust while operating. Do not touch or adjust while operating.

08/06/2013 11:14

The Iowa DOT Wheel-path Technique

- What:

- Purposely focusing all material to the wheel track
 - Can be right, left, or both
 - Both for anti-icing and deicing

- Why?

- Very high concentration in a wheel path creates a very 'quick burn' down to the pavement
- Drivers have good grip on at least 2 wheels
- Mobility restored quickly and with little salt
- Any bounce and scatter is far from the edge. Will land on the pavement where it can be useful

What About the Rest of the Road?

- Traffic and road crown quickly spread salt to other areas
- Enough to help, but the majority stays in the tracks – where it's most needed

Notice these fresh, “tight” strips of antiice.

Even before the end of the route these narrow patterns do spread a little

Notice how little melting
there is just past the paint
lines.

Yet the mainline is bare.
The salt stayed in place.

For a road like this, it is ok for us to have snow on the paint during a storm. There is often enough salt, migrated by traffic and flowing down the crown, that the snow is unbonded beneath and will clean up easy. For now drivers have good mobility and can easily see their way.

Works well for interstates too, just rates may be a little higher to meet the required Service Level. But not much. Salt rates rarely exceed 250 lbs/lm even on our biggest roads

Equipment

This Technique Can be Started Simply...

- First units were cut PVC pipes and reused signs
- Anything that would focus the material and minimize bounce and scatter

Spreader designs have been tested in 2013 and 2023 for bounce and scatter reduction

08/06/2013 11:28

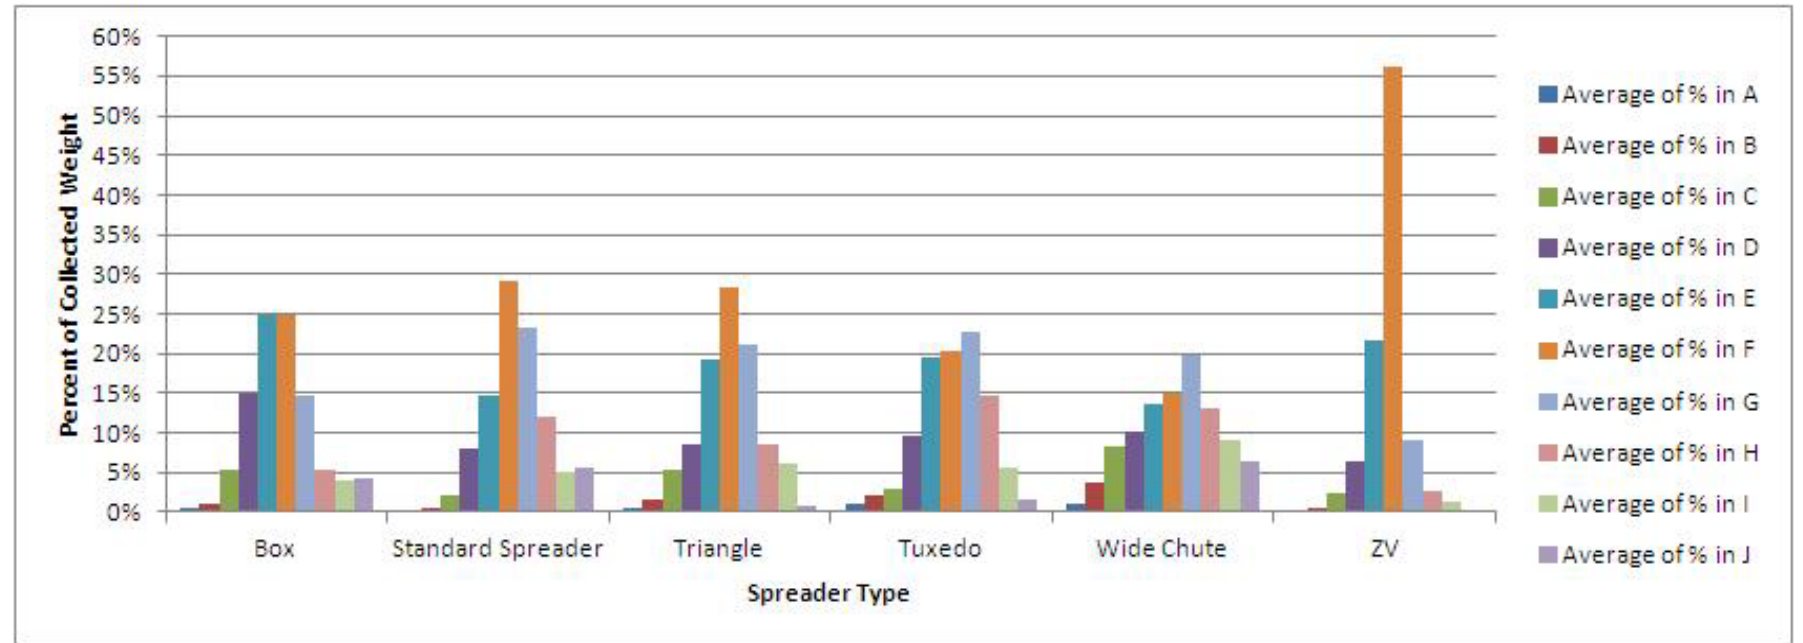

08/05/2013 15:02

08/06/2013 11:51

- How you spread salt matters

- Dry or prewetted?
- Speed
- What kind of spreader are you using?
- What pattern are you aiming for?

Refinements

More Brine!

- Brine use is great for making salt stick regardless of technique
- Especially good for wheel-path since it enables the quick burn and the downhill flow of chemical

Oops...

If we do end up with bonding, a trickle of brine running down the slope can undercut the ice and perhaps allow us to scrape it off without having to melt it top-down

08/06/20

Notice the brine hoses to all of these spreaders

08/06/2013 11:14

08/06/2013 10:42

Drivers will have to consider slope. This driver is approaching a banked left curve and has switched granular drop to the right side to maximize chemical concentration on the uphill side.

Brine is still present at both sides – the left side is the ‘box sprinkler’ type and you can see the brine here.

Once back to straight, it's back to left side granular (material focused at crown) and brine only right.

Even Anti-Ice Pattern is Modified

Nozzles like these are becoming less common

- Brine sticks great but nozzles still have some spray/drift
- We are often pumping 50+ gal/LM and it creates a lot of droplets that blow

ate Univ
MILE

↑

111A
EXIT
↑

- Open ended nozzles don't create as much spray, even at faster speeds

If you look closely, you can see that there is still some spray, and that will help protect the 'rest of the road'

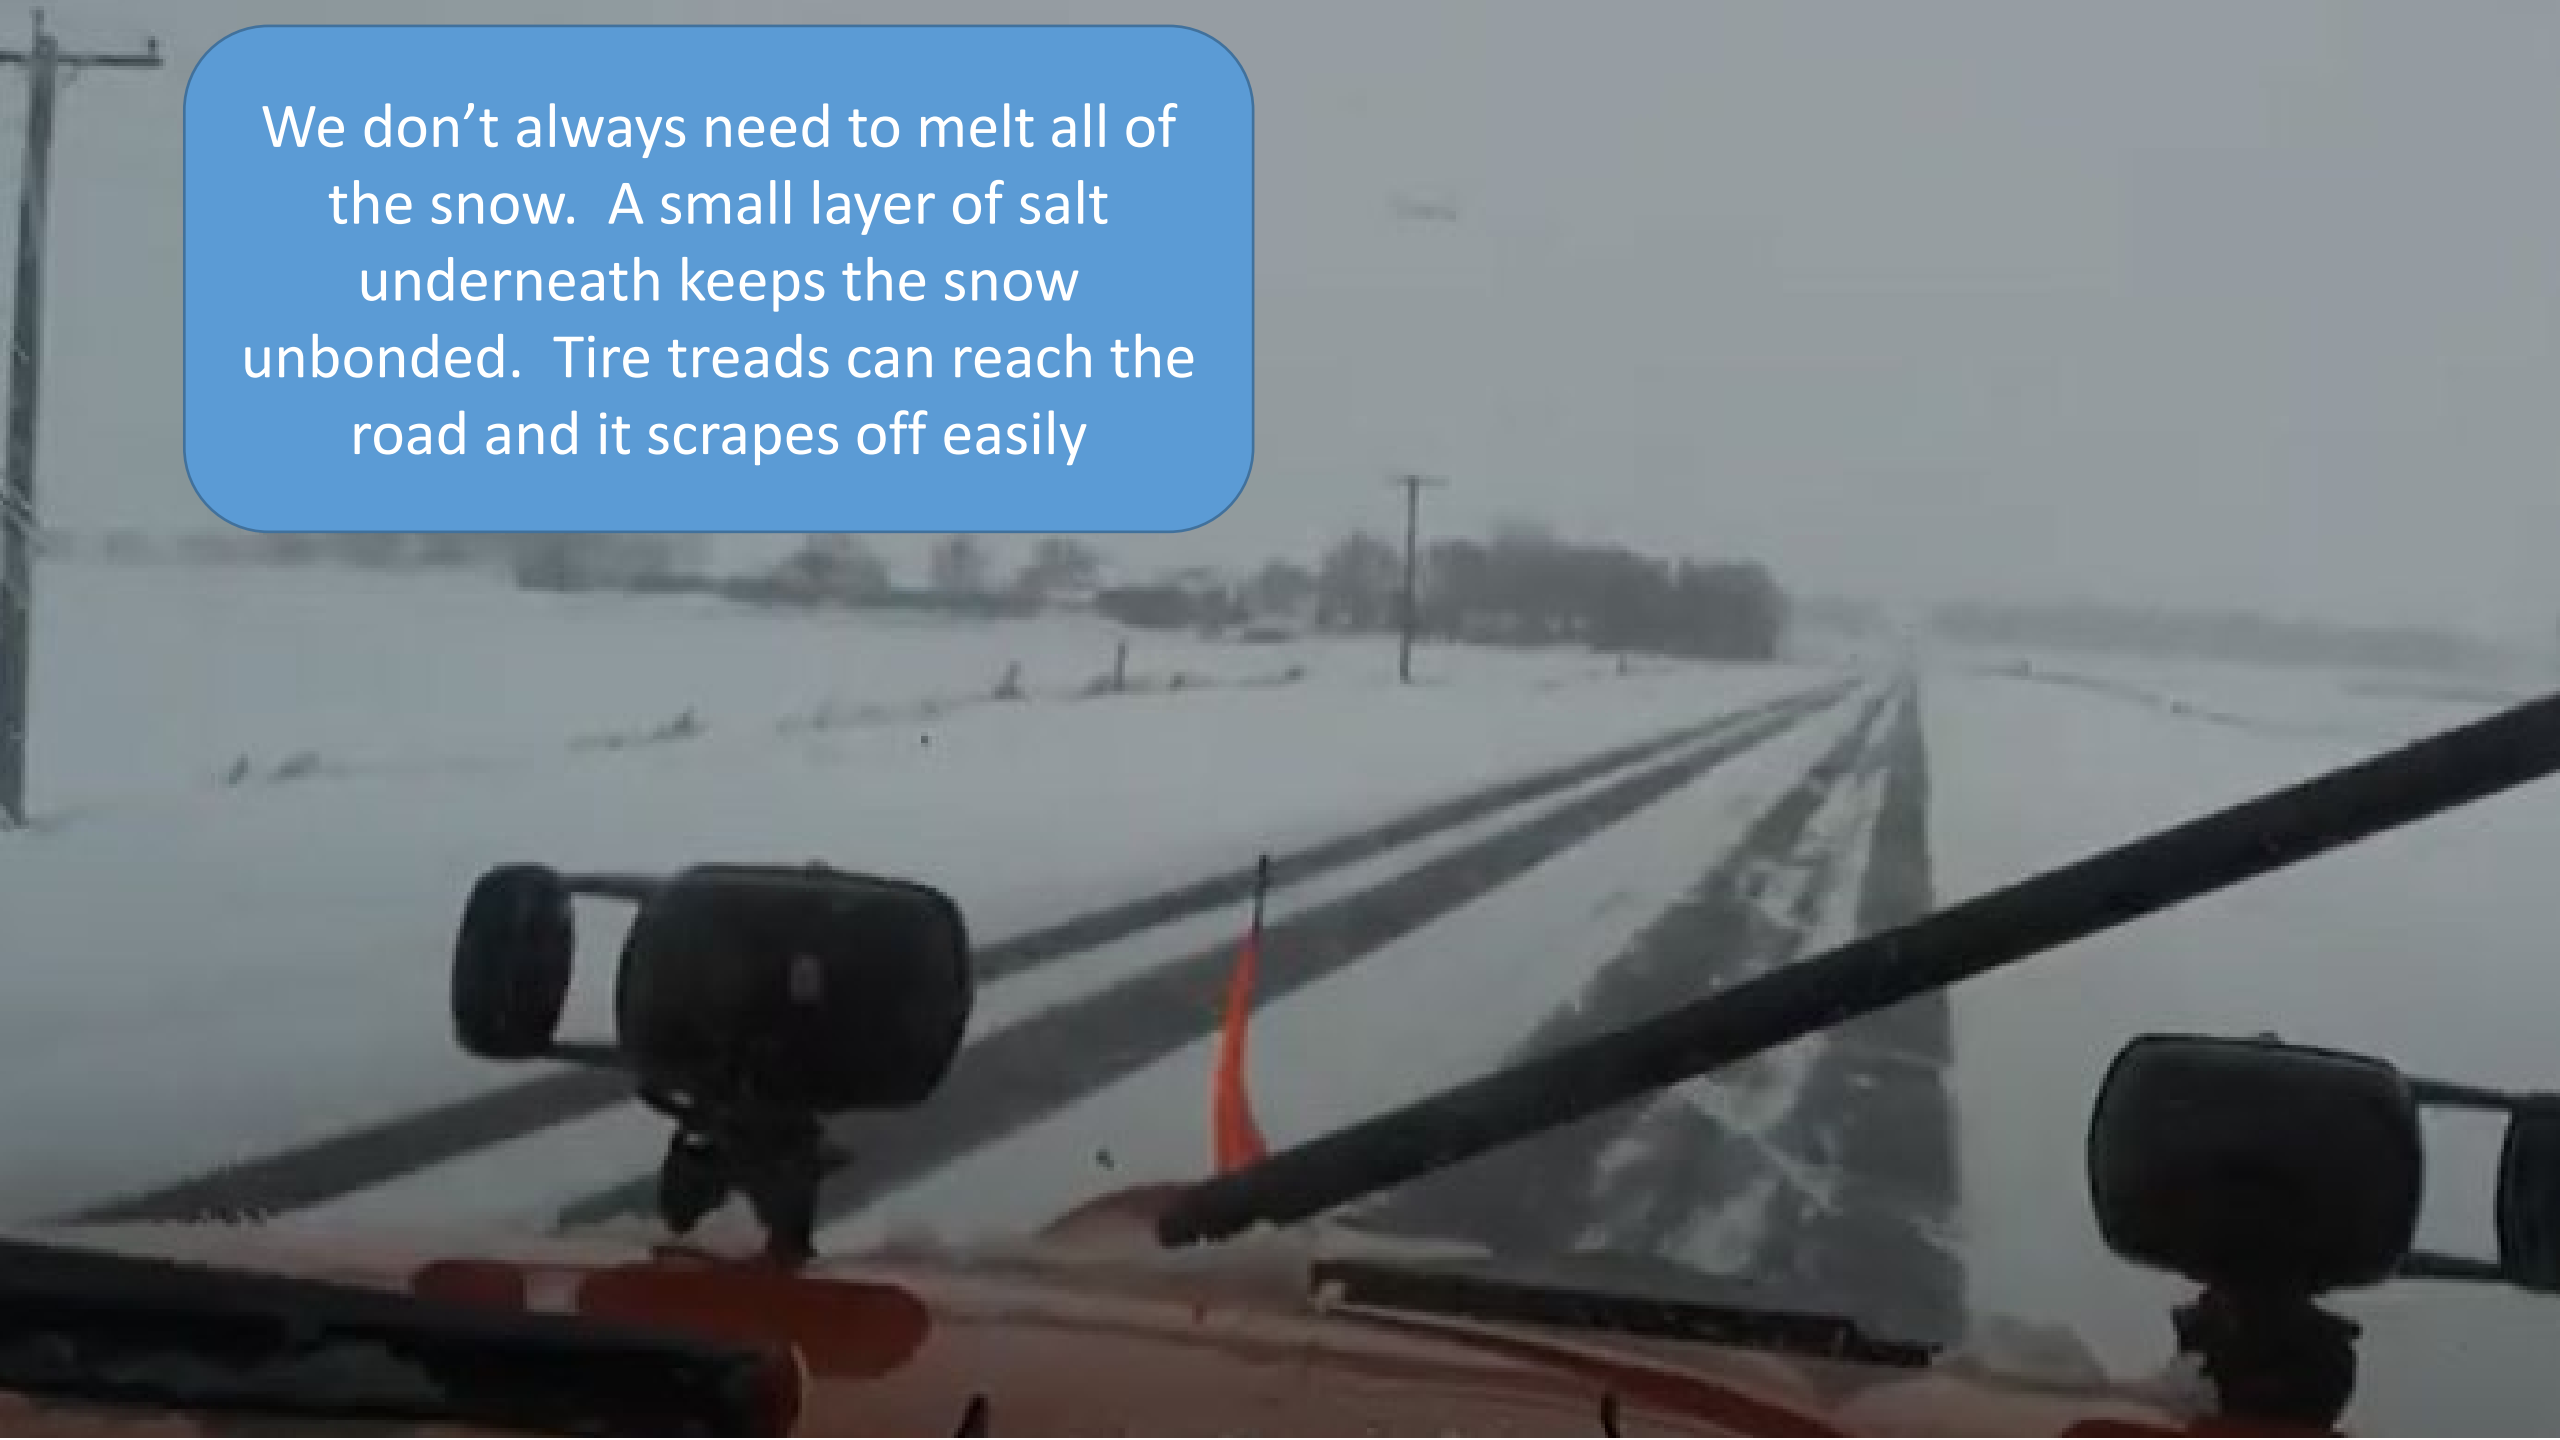

But also very little passing either paint line.

We don't always need to melt all of the snow. A small layer of salt underneath keeps the snow unbonded. Tire treads can reach the road and it scrapes off easily

Main Points: Wheel Track Pattern

- Purposely focusing all material to the wheel track(s)
- Very high concentration in a wheel path creates a very quick melt down to the pavement
- Drivers have good grip on at least 2 wheels
- Mobility restored quickly and with little salt
- Any bounce and scatter is far from the edge. Will land on the pavement where it can be useful
- Traffic and road crown quickly spread salt to other areas, enough to help, but the majority stays in the tracks – where it's most needed

AVL and Salt Use Tracking

GPS/AVL & Plow Cam History

2010

**AVL
program
begins**

2011/2012

**Trial AVL
Deployment
(LTI – Vendor)**

2012/2013

**Full AVL
Deployment**

2013/2014

**Basic plow
data for the
public**

**Introduced
Plow Cam
cameras -300
iPhones**

2014/2015

**Expanded
Plow Cam
cameras
(iPhones) to
the entire
fleet**

2015/2016

**Transitioned
to Skyhawk
as AVL
vendor**

**Added Plow
Cam camera
images to
511**

2017/2018

**Transitioned
from
iPhones to
Axis
Cameras**

**Added
snowplow
locations to
511**

GPS/AVL & Plow Cam History

2019/2020

Transitioned to Cypress as AVL vendor, utilizing same modems (CTM-200)

2020/2021

Developed Salt Ledger, Material Usage and Storm Reporting Dashboards

Began reviewing Winter Season Material Usage data with Districts

2021/2022

Added Regional winter Road Conditions to 511

2022/2023

Cypress Replaced CTM-200 modems with the CTM One Modems

2023....

AVL on 511

The screenshot displays the 511 Iowa Department of Transportation website. The browser address bar shows the URL `hb.511ia.org/#plowHome?layers=winterDriving%2CimagePlows%2ClocationPlows&timeFrame=TODAY`. The website header includes the 511 logo, Iowa DOT logo, and Iowa State Patrol logo, along with navigation links for HELP, MORE 511, TRUCKERS, WINTER DRIVING, BORDERING STATES' 511, and CONTACT. A user login option "Your 511 (sign in)" is also present. Below the header, there are utility links for Text Size, Text Only, View Streamlined Version, and Future Info. The main content area is titled "Winter Driving, Plow Cameras, Plow Locations" and features a map of Iowa with numerous orange camera icons and black plow location icons. A left sidebar menu includes options like Menu, Personalize your 511, Travel At-A-Glance, Incidents, Construction, Winter Driving & Incidents, Plow Locations and Images (highlighted), Cameras & Speeds, Rest Areas, Twitter, and Facebook. A legend is visible in the bottom right corner of the map area. The Windows taskbar at the bottom shows the search bar and several application icons, with the system clock indicating 2:35 PM on 11/11/2019.

US 59: Snow Plow Camera Today at 6:29 AM CST

Winter Operations Data

- Conduct a Post Winter Review with each District
- Discuss ideas and questions
- Meet in small groups, but everybody gets all info from all regions

The Problems With Basic Data

- Weather varies a lot!
 - Storm to storm
 - Same storm, different areas
 - Winter to Winter
- Miles and service expectations change
 - Each garage has a different mix of miles
 - Types of roads that make up each garage
 - rural low-volume vs. urban interstate?
 - We've gained about 1,000 miles in the last decade

How do you know what's good or bad, if you're improving or declining, when there are so many variables??

Salt/labor management dashboard

What

- Produces 'expected' salt/labor use for each area for each day
- Compares 'expected' vs. 'use'

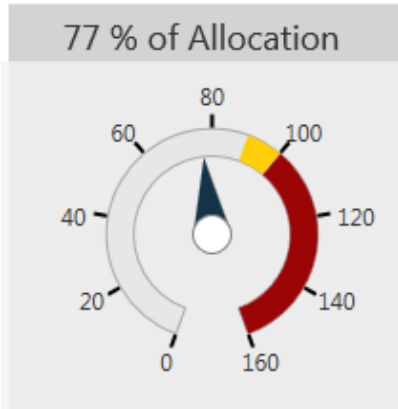

Why

- Shows how well we adhere to our use guidelines for each unique storm and location

How

- Uses detailed observed weather data
- Uses each garages' responsibility info. – lane miles and service level
- Computes expected use according to guidelines

- Finished its 12th year of operation
- Web-based
- Updates daily

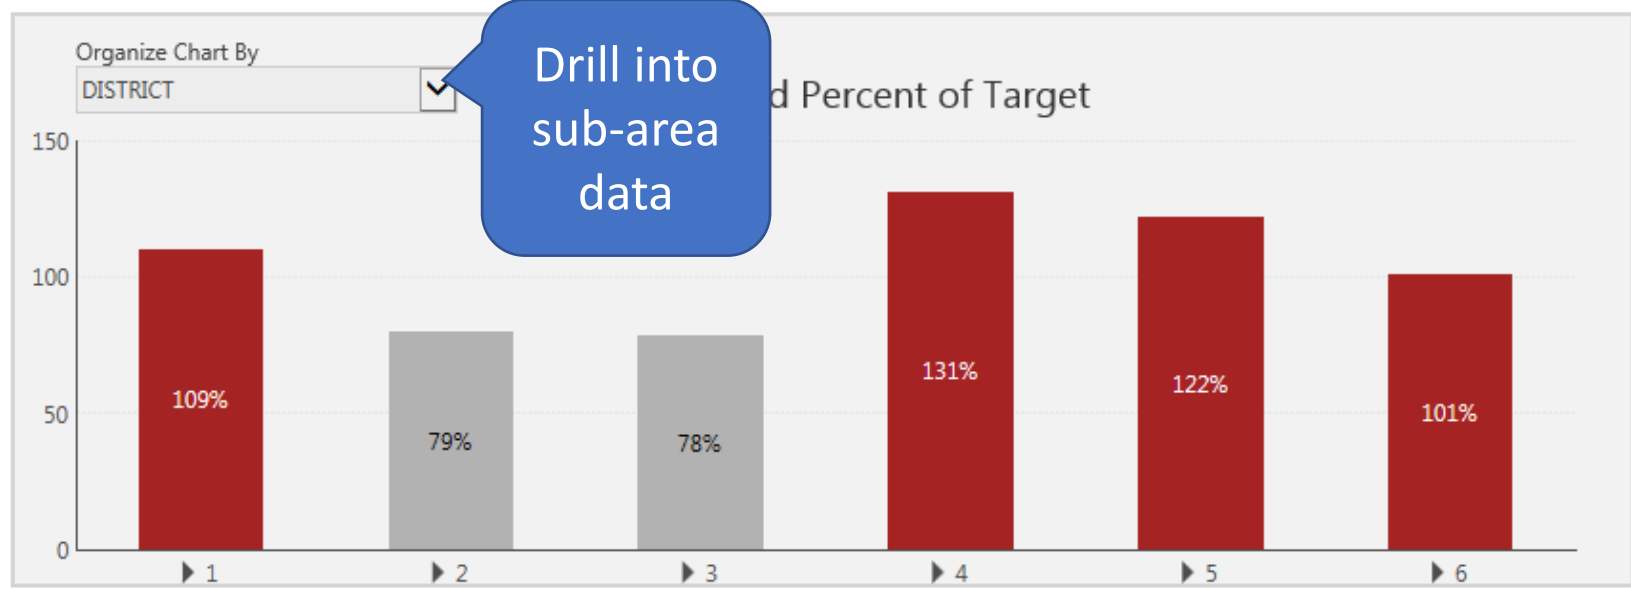

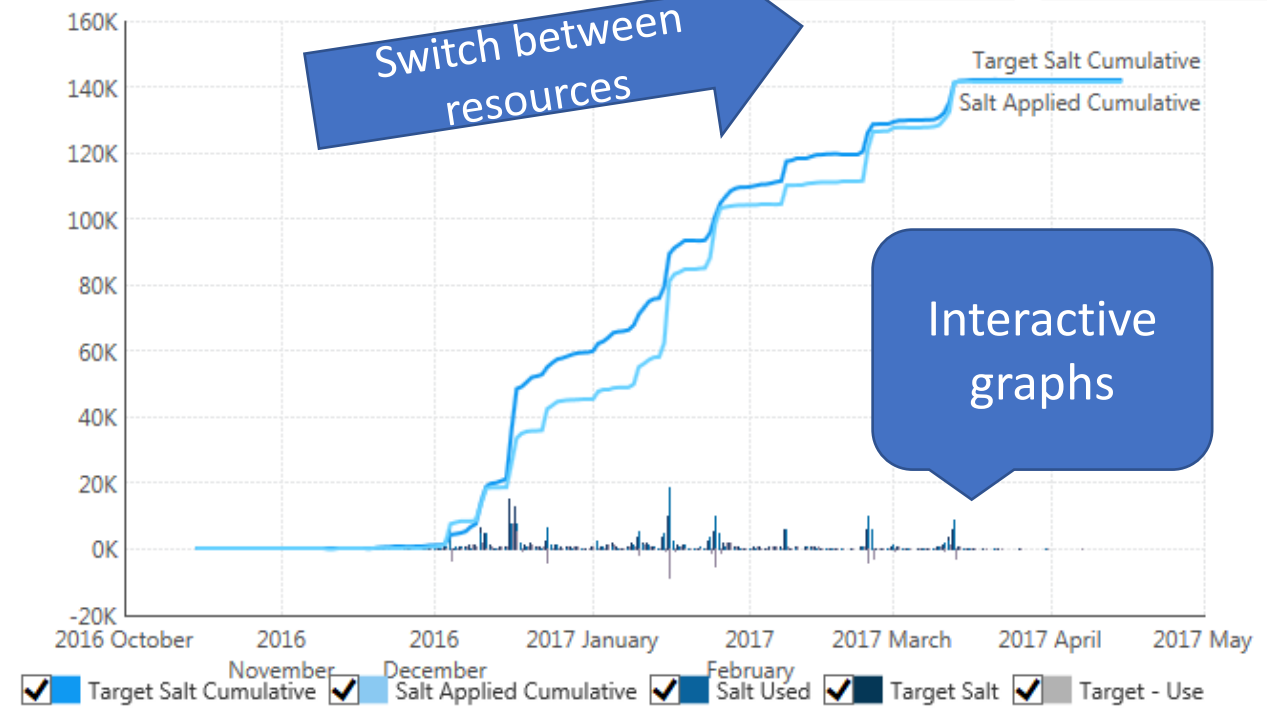

Freezing Rain Hours: 4,395
 Heavy Snow Hours: 2,921
 Medium Snow Hours: 8,378
 Light Snow Hours: 4,218
 Blowing Snow Hours: 6,864
 Frost, Refreeze, Sleet Hours: 5,785

Show Data For Location
 All

From 2016/10/15 To 2017/04/15

View 675 Hours Info View All Hours Info

Salt Applied: 141,722
 Target: 142,164
 Target Minus Use: 442
 Allocation: 184,274
 Allocation Remaining: 42,540

What Does This Mean For people?

- Targets provide a benchmark
- Visual way to compare
 - Across time or location
 - Outliers become obvious
 - Simple reporting errors
 - Unusual use
- New data daily
 - Catch potential problems early

Freezing Rain Hours: 4,395
 Heavy Snow Hours: 2,921
 Medium Snow Hours: 8,378
 Light Snow Hours: 4,218
 Blowing Snow Hours: 6,864
 Frost, Refreeze, Sleet Hours: 5,785

How It's Made: Automating Our Rate Guidelines

Salt Application Rate Guidelines							
Assuming:	Prewetted salt & 12-foot lane	Hours: 2			Level:	standard	100%
	Surface Temperature (F):	33-30 F	29-27 F	26-24 F	23-21 F	20-18 F	17-15 F
Pounds of Salt*	Heavy Frost, Light Snow	50	75	95	120	140	170
	Medium snow (1/2 inch per hour)	75	100	120	145	165	200
	Heavy Snow (one inch per hour)	100	140	185	250	300	350***
	Freezing rain, drizzle, sleet	140	185	250	300	350***	400***

Pavement temperature from RWIS stations

Our spreaders are capped at 300 lbs/LM

Precip type and duration from crew records

Salt Application Rate Guidelines							
Assuming:	Prewetted salt & 12-foot lane	Hours: 2		Level:	standard	100%	
	Surface Temperature (F):	33-30 F	29-27 F	26-24 F	23-21 F	20-18 F	17-15 F
Pounds of Salt*	Heavy Frost, Light Snow	50	75	95	120	140	170
	Medium snow (1/2 inch per hour)	75	100	120	145	165	200
	Heavy Snow (one inch per hour)	100	140	185	250	300	350***
	Freezing rain, drizzle, sleet	140	185	250	300	350***	400***

- Rates are assessed in 10 minute periods
- For example, 140 Pounds/LM in 2 hours = 11.67 Pounds/LM in 10 minutes
- 10-minute scale lets the salt rate adjust as temperatures or storm types change
- Adds up all of the 10-minute amounts to create daily rates

How It's Made

Each 10-minute estimate is added up for a day. This is a garage's daily target salt pounds per lane mile

Multiply by each garage's lane miles (weighted by service level)

Daily Total Pounds Per Lane Mile * Weighted Miles / 2000 = **Daily Target Tons**

How Has Salt Use Changed?

- Overages tend to be less over
- More years under, and further under.

Salt Use Difference From Expected (Tons)

Performance Changes

FY 2007-2011 Average Hours to Normal:
A – 13.0
B – 12.4
C – 12.6

FY 2012-2018 Average Hours to Normal:
A – 10.5
B – 10.5
C – 10.6

Hours to Normal Driving Conditions

- Average number of hours it took to return Interstates to normal surface condition after crew deployment:
- Average number of hours it took to return 4-lane and major 2-lane highways to normal surface condition after crew deployment:
- Average number of hours it took to return low-traffic two-lane highways to normal surface condition after crew deployment:

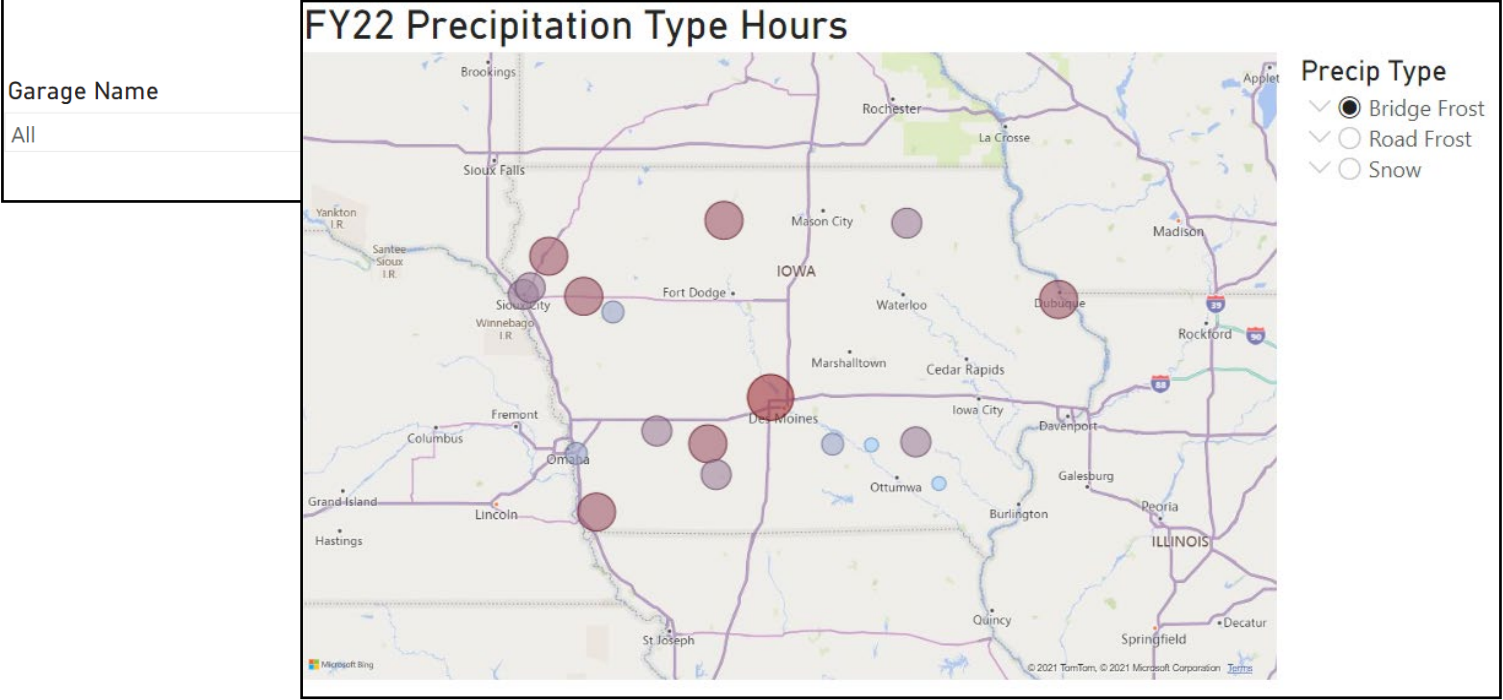

Material Use and Storm Info Dashboard

- Shows statewide storm hour and snow amount comparisons
- Material usage detail for user-selectable years or time frames
